

Roaming with Cisco Catalyst Wireless: how we do it

March 21st 2024

Hafida Barhoun – Technical Solutions Architect at Cisco CCIE Routing &Switching #65298

A little bit about myself

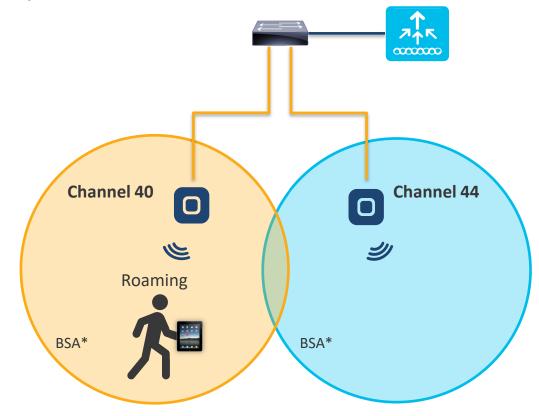

- Joined Cisco in 2018
- Technical solutions Architect focused on wireless since January 2021
- Cisco Live NoC Member (Barcelona 2020 & Amsterdam 2023)
- Freshly mom of two kids

Roaming Definition

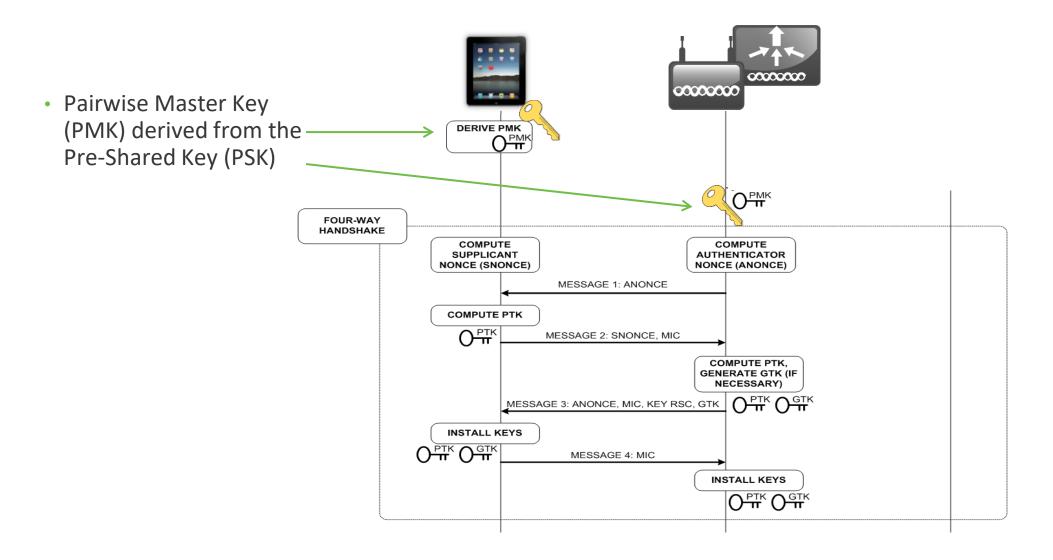

- In a Wi-Fi network, roaming occurs when a station moves, or leaves the coverage area (BSA*) of the AP to which it was originally connected, and arrives at the BSA of another AP.
- It's the ability to maintain client's association seamlessly from one access point to another, securely and with as little latency as possible.

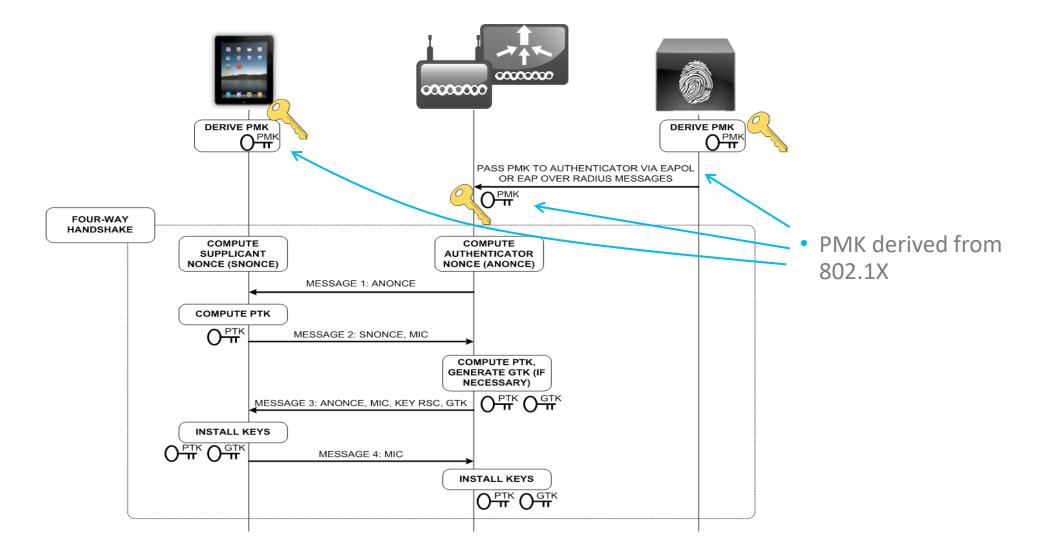

* Basic Service Area

Roaming Techniques

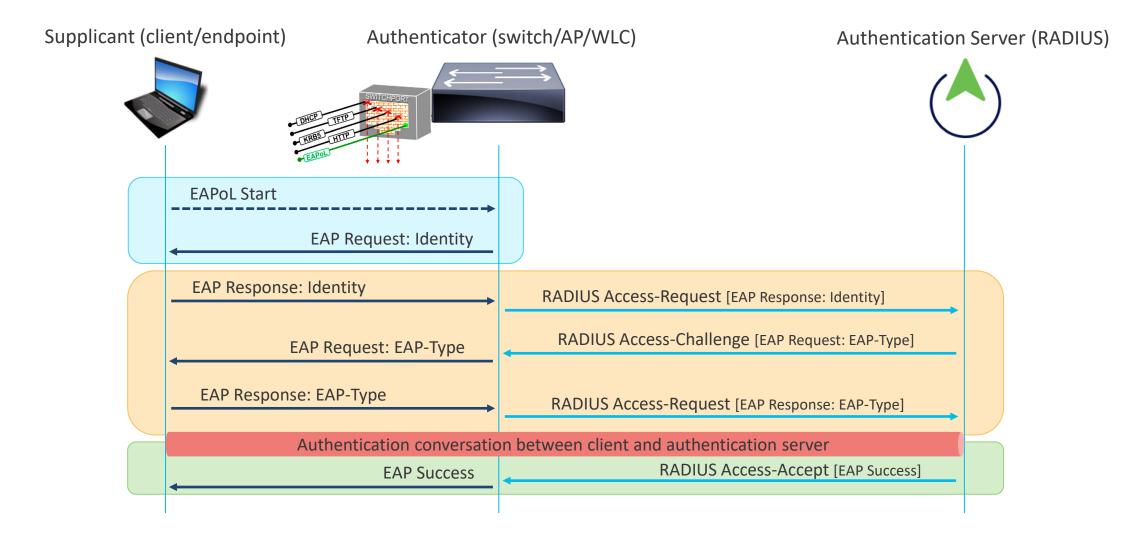

PSK/static key management with WPA2

802.1X/dynamic of key management with WPA2

EAP/802.1X Call Flow

L2 and authentication keys reuse

The 4-way handshake doesn't take long and doesn't "break" L2 connectivity EAPoL Start COMPUTE COMPUTE SUPPLICANT AUTHENTICATOR NONCE (ANONCE) NONCE (SNONCE) EAP Request: Identity MESSAGE 1: ANONCE EAP Response: Identity COMPUTE PTK RADIUS Access-Request [EAP Response: Identity] От MESSAGE 2: SNONCE, MIC RADIUS Access-Challenge [EAP Request: EAP-Type] EAP Request: EAP-Type COMPUTE PTK. GENERATE GTK (IF NECESSARY) EAP Response: EAP-Type RADIUS Access-Request [EAP Response: EAP-Type] INSTALL KEYS Authentication conversation between int and authentication server MESSAGE 4: MIC EAP Success RADIUS Access-Accept [EAP Success] INSTALL KEYS A full 802.1X (re)authentication Endpoint Access Point Wireless LAN Controller takes too long, "breaks" L2 (WLC) connectivity and even causes the 802.11 CAPWAP 0000000 client to go through DHCP again 00000000 **Probe Request** Probe Request (forwarded) **Probe Response** Authentication Request Authentication Response (Re) Association Request (Re) Association Response MAC Filtering and/or 802.1X Layer 2 EAPoL Keys exchange (in case of PSK or 802.1X) Authentication DHCP / DNS Laver 3 Web Captive Portal Authentication

Supplicant (client/endpoint)

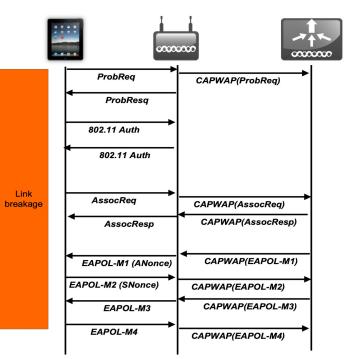

Authenticator (switch/AP/WLC)

Authentication Server (RADIUS)

The different roaming techniques

Link breakage

Opportunistic Key Caching (OKC)

Not an official standard, but widely agreed between different vendors since many years. ~8-100 ms Cisco Centralized Key Management (CCKM)

00000000

CAPWAP(ProbReg)

CAPWAP(AssocReq) CAPWAP(AssocResp)

ProbReg

802.11 Auth

AssocRea

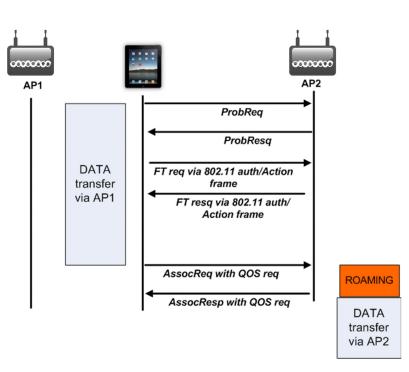

ProbResa

802.11 Auth

AssocResp

0000000

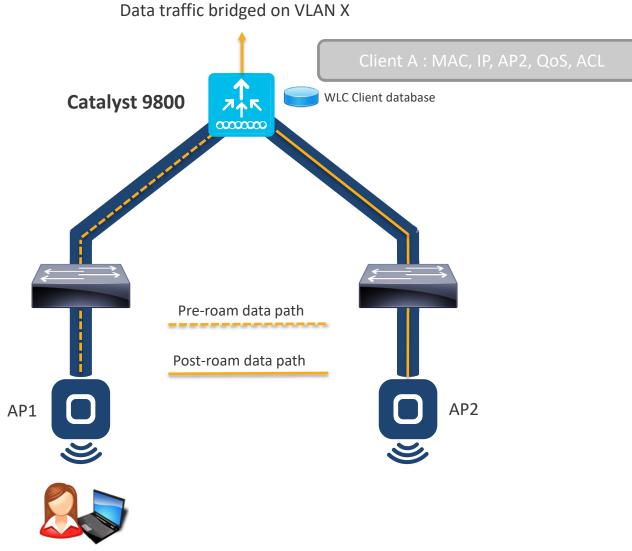

A Cisco proprietary technique, open to 3rd party endpoints too (to be checked). ~4-50 ms The real standard, today widely supported by the vast majority of endpoints. ~< 10 ms

Different types of roaming

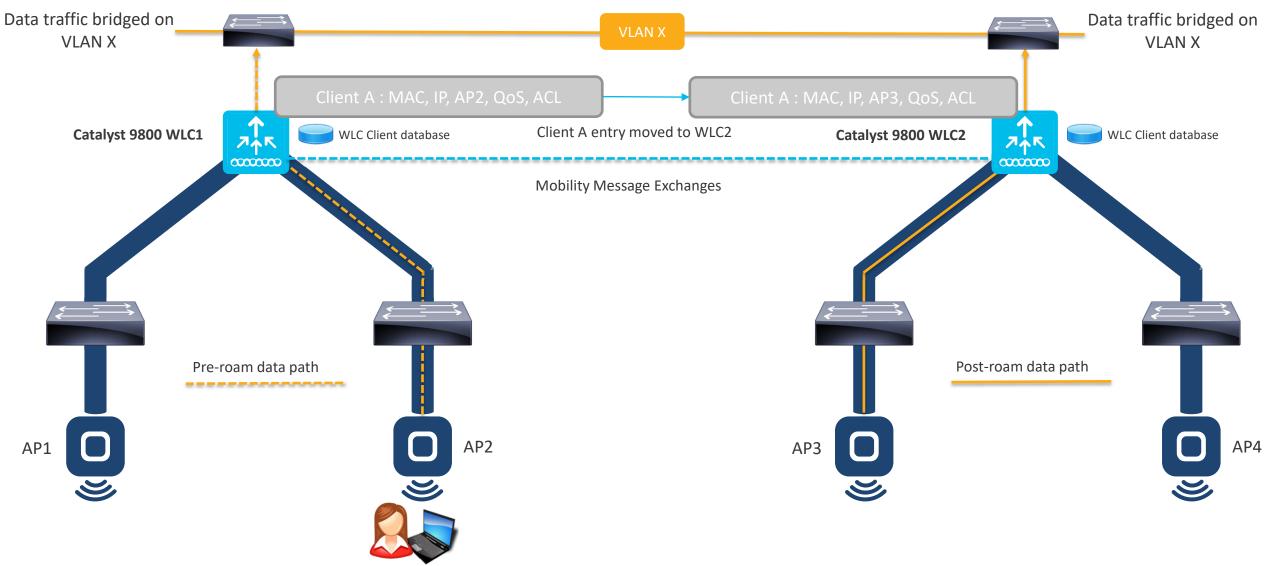

Intra-controller roaming

Client roams from AP1 to AP2

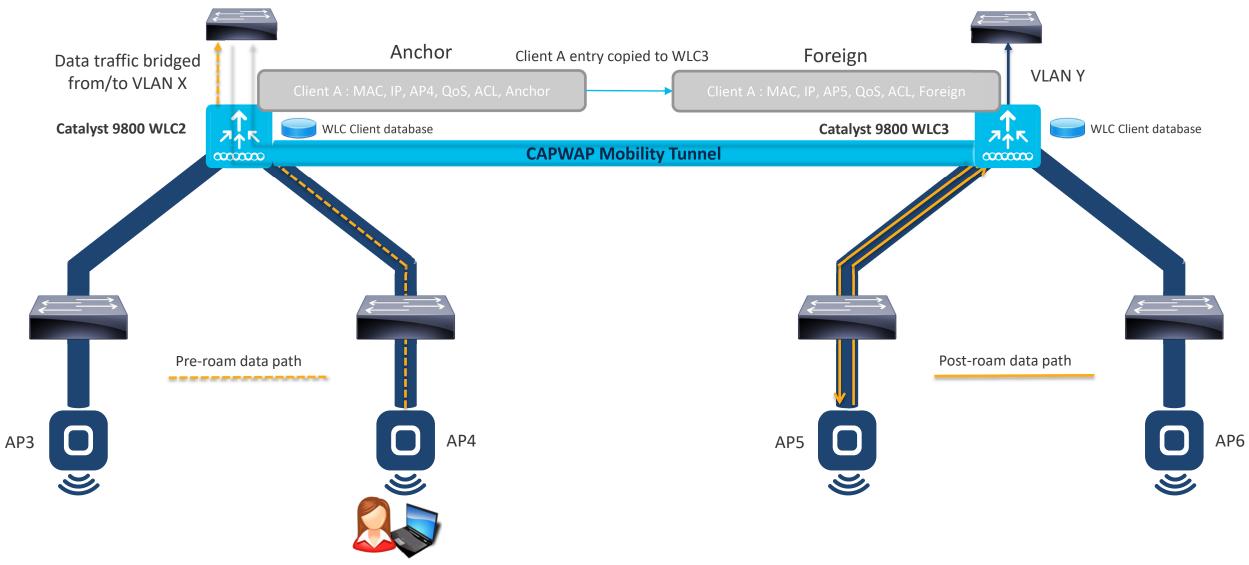

CAPWAP Tunnel

Inter-controller roaming (L2)

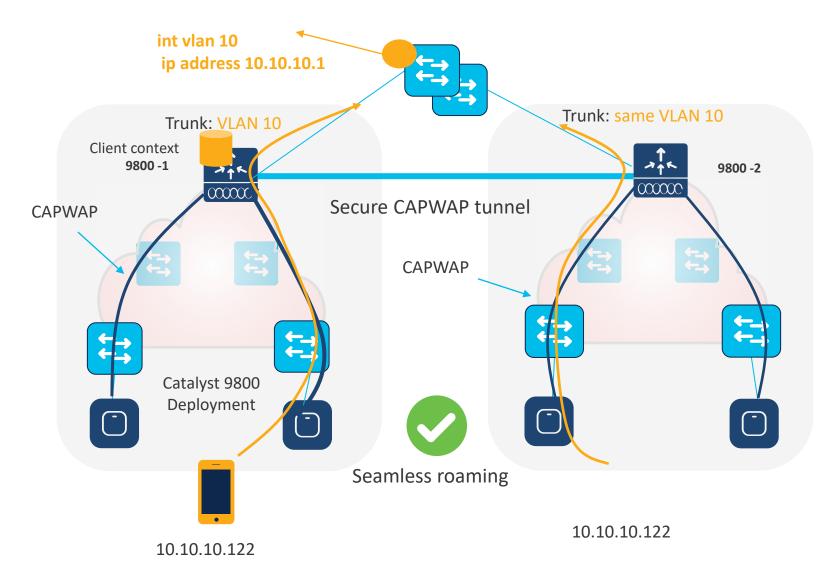

Client roams from AP2 to AP3

Inter-controller roaming (L3)

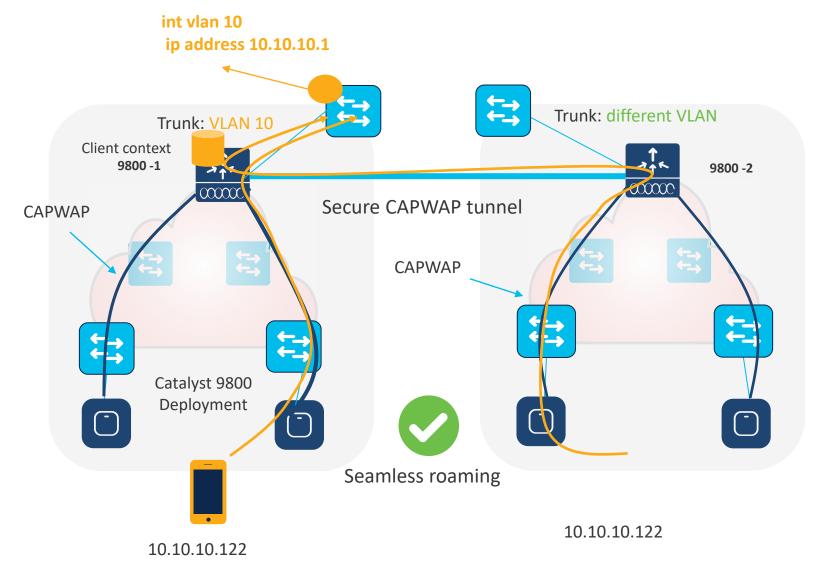

Client roams from AP4 to AP5

L2 vs. L3 seamless roaming – what's different?

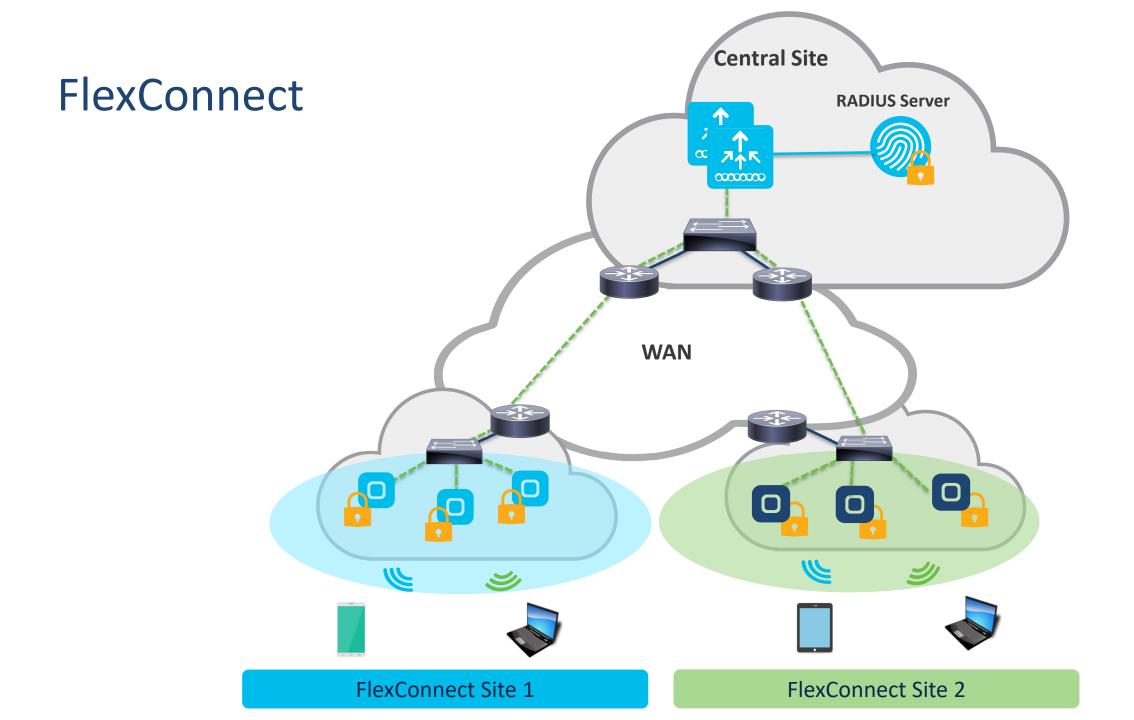

- Seamless roaming needs the two controllers in the same Mobility Group
- What differentiates L2 vs. L3 roaming?
- In C9800, it's only **the vlan number (ID)**, not the vlan name AND not the subnet
- Same VLAN ID > L2 roaming

L2 vs. L3 seamless roaming – what's different?

- Seamless roaming needs the two controllers in the same Mobility Group
- What differentiates L2 vs. L3 roaming?
- In C9800, its only the vlan number
- Same VLAN ID > L2 roaming
- Different VLAN ID > L3 roaming
- This is independent of SVI being present and the subnet specified
- Why? C9800 doesn't mandate an IP address for the client VLAN (like dynamic interface for AireOS)
- Note: if you configure the same VLAN ID on both c9800 but then map it to a different subnet, you will break roaming

Client Roaming & Best practices

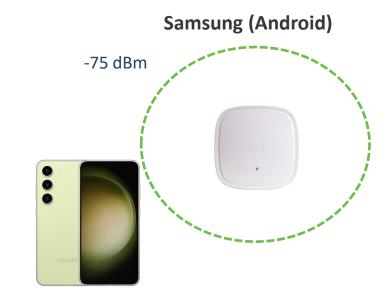

Roaming is the endpoint decision

- Phones do not scan 'because you move' (no accelerometer trigger)
- Common client roam triggers:
 - Low RSSI
 - Max retry count is exceeded
 - Low SNR
 - Proprietary algorithm

- If current AP signal is below -70 dBm OR beacon loss > 2 seconds:
 - Scan, join AP with 8 dB better than current AP
 - if client is not sending data, only join if new AP is 12 dB better than current AP
 - If 2 APs or more are better than -65 dBm, prefer the 5GHz AP

https://support.apple.com/en-us/HT203068

Android behavior depends on vendor, above is Samsung S8 and later

- If current AP signal is below -75 dBm OR if beacon loss > 2 seconds, OR if (RSSI lower than -65 dBm and CU > 70%) :
 - Scan, join AP with signal 10 dBm better than current AP
 - Samsung uses the 'short scan' (remembered channels first)

		Directed Multicast Service			

Data rates

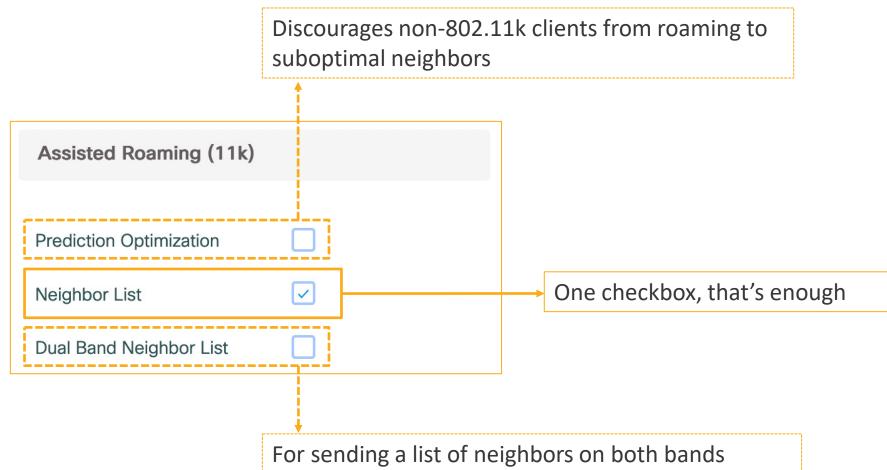

Edit RF Profile	Example for 5 GHz
General 802.11 RRM Advanced	
Operational Rates	
6 Mbps Disabled	Lowest mandatory: the data rate at which the endpoint must be able to decode management frames to associate.
9 Mbps Disabled	If we don't support this, we cannot associate.
12 Mbps Mandatory	
18 Mbps Supported	
24 Mbps Mandatory	Highest mandatory: the data rate at which multicast frames will
36 Mbps Supported	be sent.
48 Mbps Supported	
54 Mbps Supported	

Higher data rate → Better modulation → Better signal → Closer to the AP → Smaller cell size

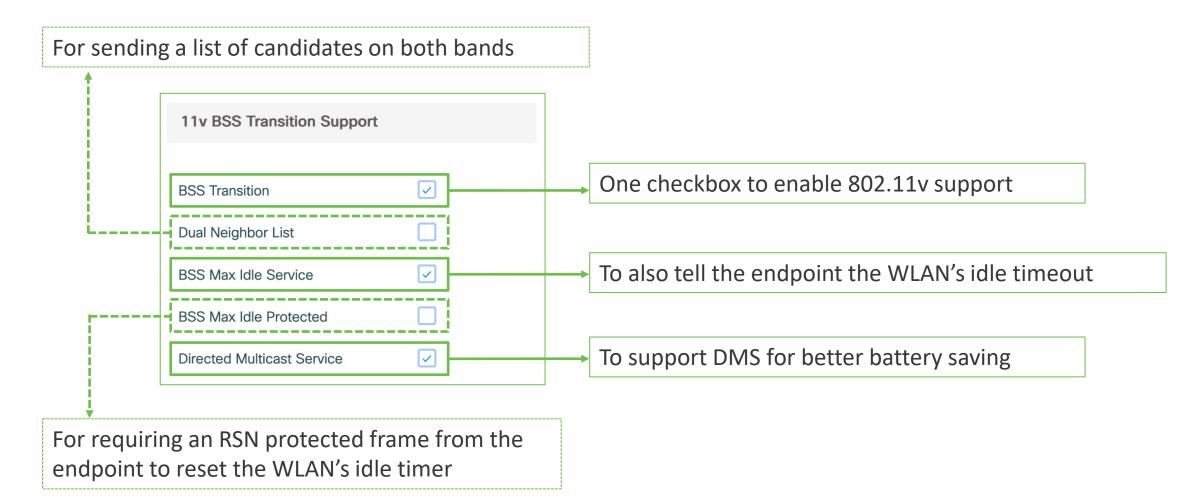

Data rates can exclude modulations/endpoints

Edit RF Profile	Example for 2.4 GHz	Example for 2.4 GHz	Edit RF Profile	
General 802.11 RRM Advanced			General 802.	11 RRM Advanced
Operational Rates			Operational Ra	tes
1 Mbps Disabled			1 Mbps	Disabled v
2 Mbps Disabled			2 Mbps	Disabled v
5.5 Mbps Disabled	802.11b modulations/endpoints are allowed, and 802.11g too		5.5 Mbps	Disabled v
6 Mbps Disabled			6 Mbps	Disabled 🗸
9 Mbps Disabled			9 Mbps	Disabled 🗸
11 Mbps Mandatory	802.11g only modulations/endpoi	ints aro	11 Mbps	Disabled v
12 Mbps Supported	allowed, but not 802.11b		12 Mbps	Mandatory 🗸
18 Mbps Supported			18 Mbps	Supported v
24 Mbps Supported			24 Mbps	Supported 🔻
36 Mbps Supported			36 Mbps	Supported 🗸
48 Mbps Supported			48 Mbps	Supported 🗸
54 Mbps Supported			54 Mbps	Supported 🗸

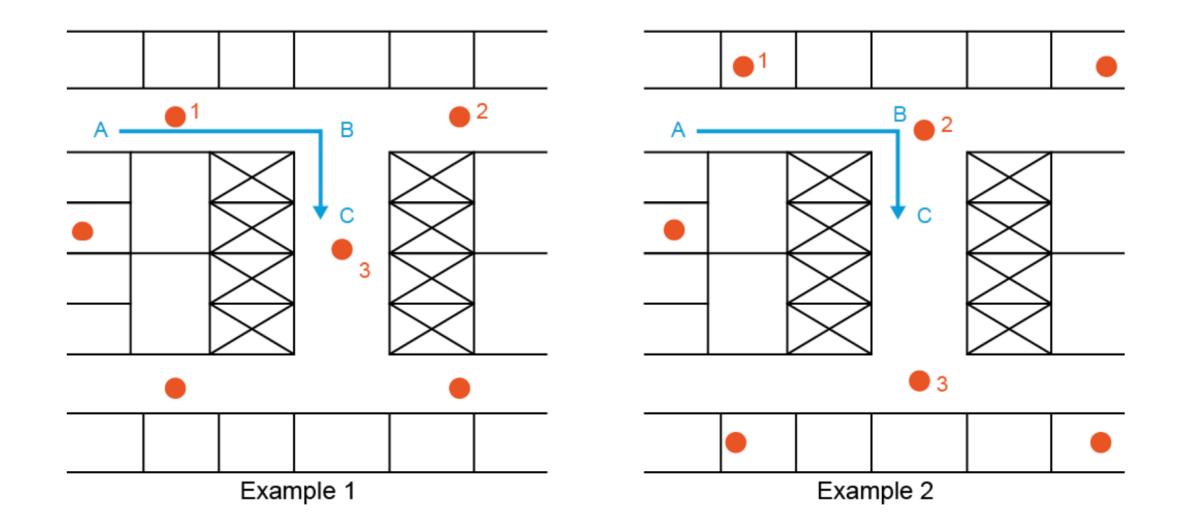

802.11k

802.11v

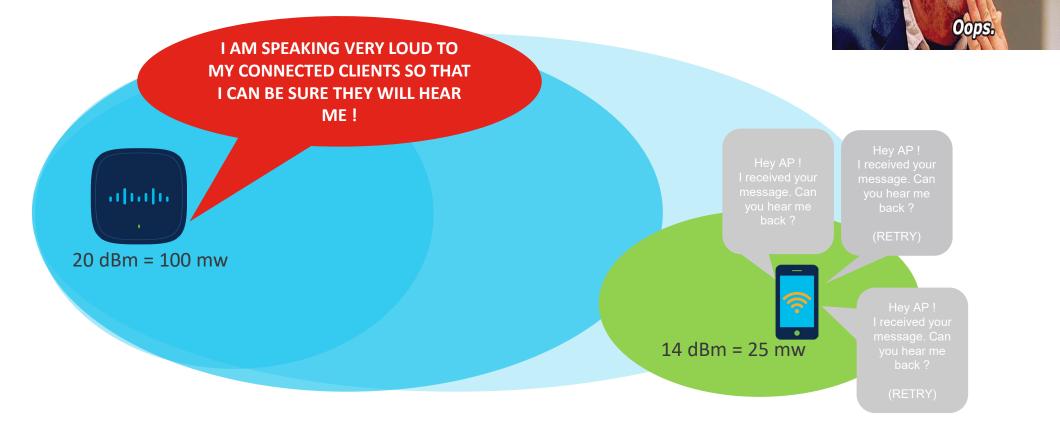

Designing the roaming path

AP Power Level

- Do not use maximum power level
- The AP power level should match the client power level.
- Use TPC

Optimized roaming and RX-SOP

Optimized roaming

- Addresses the sticky client challenge
- Proactively disconnect clients
- Disassociates client when the RSSI is lower than the set threshold

RX-SOP

- Determine if the AP should demodulate the signal or not
- Set a value below which an AP will ignore the client
- Fine tuning

- Keep intra-controller roaming as possible
- Use video call, facetime, ping to test roaming
- Activate 11r/k/v
- Influence the roaming with data rates
- Design an optimized roaming path
- Design your network with sufficient number of AP

IF

- Don't use maximum power level
- Don't test roaming with web browsing
- Be careful with what you activate
- Do not put all your controller in a same mobility group, because it is so simple ⁽³⁾
- Don't forget that site survey is your friend (Before & After)
